

AUTOCORRECT TOOL USING AI

Submitted By: Avanish Maurya

Course: B.Tech CSE

**College Name: Khwaja Moinuddin Chisti Language
University**

Session: 2026-27

➤ **Introduction**

Autocorrect Tool is an AI-based application that automatically finds and corrects spelling mistakes in text. We use autocorrect in mobile phones, chat applications, search engines, emails, and word processors every day. It helps users type faster and reduces spelling errors.

In this project, the user enters a sentence with spelling mistakes. The system processes the text and displays the corrected sentence as output.

The main aim of this project is to learn basic concepts of Artificial Intelligence (AI), Natural Language Processing (NLP), and text processing using Python. This project is simple, useful, and beginner-friendly.

➤ **Objective**

The main objective of the Autocorrect Tool project is to automatically detect and correct spelling mistakes in text using Artificial Intelligence and Natural Language Processing techniques.

Objectives of the Project

- To develop a simple, autocorrect system using Python.
- To identify incorrect or misspelled words in a sentence.
- To replace wrong words with correct words automatically.
- To improve typing accuracy and save user time.
- To learn the basics of AI and NLP.
- To create a beginner-friendly AI project using Python.

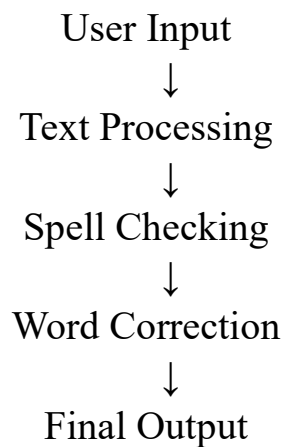

➤ **Tools and Technologies**

Tool	Purpose
Python	Programming Language
Text Blob	Spell Correction
NLTK	NLP Processing
Google Collab	Online Coding Platform

➤ **Methodology / Working Process**

The Autocorrect Tool works by taking text input from the user, checking spelling mistakes, and displaying the corrected sentence as output.

Flowchart

➤ Code:

- **Install library**
!pip install textblob
!pip install nltk
- **Import library**
from textblob import TextBlob
import nltk
- **Download NLTK Data**
nltk.download('punkt')
- **Write Autocorrect Program**
text = input("Enter your sentence: ")

blob = TextBlob(text)

corrected_text = blob.correct()

print("Corrected Text:", corrected_text)

➤ Output:

```
[16]  
✓ 21s text = input("Enter your sentence: ")  
  
blob = TextBlob(text)  
  
corrected_text = blob.correct()  
  
print("Corrected Text:", corrected_text)  
  
▼ Enter your sentence: I havv a dreem  
Corrected Text: I have a dream
```

➤ **Conclusion:**

The Autocorrect Tool is a simple and useful AI-based project that helps users detect and correct spelling mistakes automatically. The project is developed using Python and the Text Blob Official Documentation library for text correction.

This project helps in understanding the basic concepts of Artificial Intelligence (AI), Natural Language Processing (NLP), and text processing. The system takes incorrect text as input, processes it, and provides corrected text as output.

The project is beginner-friendly and can be used in applications like mobile keyboards, chat applications, email systems, and search engines. Although the basic model has some limitations in understanding sentence context, it can be improved further using advanced NLP models like BERT by Google Research.

Overall, the Autocorrect Tool is an effective project for learning AI and developing practical text correction applications.
